(302) 803-0285

The Woodlands, TX

Software engineer with 2 years of production experience at AWS building and operating customer-facing APIs in Java and TypeScript, plus shipped consumer products with real users. Seeking full-stack engineering roles.

EXPERIENCE

- **Independent Software Engineer** Remote
Full-Stack & Applied ML Aug 2023 – Present
 - **Lux — Local-First New Tab Dashboard:** Designed and shipped an open-source Chrome and Brave extension (Manifest V3) replacing the new tab page with a configurable drag-and-resize dashboard of nine widgets, backed by a persisted Zustand layout engine with no backend database. Integrated five account providers (Google Calendar, Outlook, Spotify, GitHub, AniList) by routing confidential-client OAuth through a self-hosted, stateless Cloudflare Worker token relay — keeping client secrets off the extension bundle and all user data on-device.
 - **Mira — Job Application Auto-Filler:** Published Chrome Web Store extension that auto-fills job applications across five ATS platforms (Ashby, Greenhouse, iCIMS, Lever, Workday). Runs an on-device ML model (Transformers.js) that classifies nearly 60 form field categories and maps them to a saved profile, including Workday's multi-page experience, education, and self-identification flow. Ships an answer bank, per-role profile presets, and an application tracker with CSV export — with zero servers, accounts, or analytics.
 - **Steam Launcher — Flow Launcher Plugin:** Native C#/.NET plugin exposing 12+ Steam commands from a single keystroke, spanning game launching, store search, friends, account switching, and shared-multiplayer matching. Async background loading renders the installed library immediately while Steam Web API metadata, friends-playing status, and store results stream in.
 - **hyunwk.me — Interactive 3D Portfolio:** WebGPU/React Three Fiber scene rendering a hand-modeled 49-mesh Blender room with three playable in-scene arcade games. Built a Python/NumPy pipeline morphing an 8,000-point hologram between six shapes, using cached k-nearest selection to solve 64M-pair correspondence without the $O(n^3)$ cost of optimal assignment.
 - **Technologies:** React 19, TypeScript, C#/.NET, Python/NumPy, Three.js (WebGPU/TSL), React Three Fiber, Tailwind CSS, Zustand, Vite, Vitest, Cloudflare Workers, Transformers.js, Chrome Extensions API, Blender
- **Amazon Web Services** New York, NY
Software Development Engineer I — Amazon Connect June 2022 – Aug 2023
 - **API Performance:** Rebuilt pagination and query paths in the SearchCases API, resolving correctness issues in result paging and cutting response time by 30%.
 - **Secure Connectivity:** Delivered PrivateLink support for VPC-to-service traffic, enabling enterprise customers to reach Amazon Connect without routing over the public internet, with CloudWatch instrumentation for connection health.
 - **Release Automation:** Automated SDF generation and SDK integration testing, removing a recurring manual step from the release process and improving reliability of the auto-generation pipeline.
 - **Operations:** Owned CI/CD monitoring dashboards and alarms in CloudWatch; served primary on-call, resolving high-severity incidents and authoring postmortems that fed back into service health improvements.
 - **Technologies:** Java, TypeScript, Node.js, AWS (DynamoDB, S3, CloudWatch, CloudFormation), Mockito, Guice

SKILLS

- **Languages:** Java, TypeScript, Python, C#, SQL
- **Backend:** Node.js, REST API design, OAuth 2.0, DynamoDB, PostgreSQL, Guice, Mockito
- **Frontend:** React, Three.js, Tailwind CSS, Zustand, Vite, Vitest
- **Infrastructure:** AWS (DynamoDB, S3, CloudWatch, CloudFormation), Cloudflare Workers, Docker, Git, Linux, CI/CD

EDUCATION

- **Penn State University** University Park, PA
B.S. in Computational Data Science [2017 – 2022]

CERTIFICATIONS

- Google Cybersecurity Specialization — Coursera, Feb 2024
