EXPERIENCE

- **Independent Software Developer** Remote
Full-Stack & ML Development Oct 2024 – Present
 - **Lux — New Tab Dashboard:** Designed and built an open-source, local-first Chrome and Brave extension (Manifest V3) that replaces the new tab page with a configurable, drag-and-resize glassmorphic dashboard of nine widgets. Connected optional account widgets (Google Calendar, Outlook, Spotify, GitHub, AniList) over OAuth, routing confidential-client sign-in through a self-hosted, stateless Cloudflare token relay while keeping all user data on-device.
 - **Mira — Job Application Auto-Filler:** Built and actively maintain a Chrome extension, published on the Chrome Web Store, that auto-fills job applications across three major ATS platforms (Ashby, Greenhouse, Lever) — using on-device NLP (Transformers.js) to detect and map form fields to a saved profile and eliminate repetitive data entry.
 - **Steam Launcher — Flow Launcher Plugin:** Engineered a native C# / .NET plugin for Flow Launcher that drives a user's entire Steam library from a single keystroke — over a dozen commands spanning game launching, store search, friends, account switching, and shared-multiplayer matching. Integrated the Steam Web API with async background loading so installed games render instantly while metadata, friends-playing status, and store results stream in.
 - **Technologies:** React 19, TypeScript, C# / .NET, Tailwind CSS, Zustand, Vite, Cloudflare Workers, Transformers.js, Chrome Extensions API, Steam Web API
- **Amazon Web Services** New York, NY
Software Development Engineer I — Amazon Connect June 2022 – Aug 2023
 - **Enhanced API Performance:** Optimized SearchCases API, resolving pagination issues and improving search efficiency, reducing response time by 30%.
 - **Secure Network Setup:** Implemented PrivateLink for secure VPC connectivity, improving client security and monitoring with CloudWatch.
 - **Automated Release Process:** Streamlined SDF generation and SDK testing, reducing manual effort and improving the auto-generation process.
 - **DevOps and Monitoring:** Built CI/CD monitoring with CloudWatch, ensuring reliable deployments and fast incident response.
 - **On-call Leadership:** Resolved high-severity incidents and maintained service health through proactive monitoring and postmortems.
 - **Technologies:** Java, TypeScript, AWS, Node.js, Mockito, Guice

CERTIFICATES & LICENSES

- **Google Cybersecurity Specialization** Cert ID: UNA5DNWVDA69
Coursera Feb 2024

PROGRAMMING SKILLS

- **Languages:** Python, TypeScript, Java, C#, SQL
- **Technologies:** AWS (DynamoDB, S3, CloudWatch, CloudFormation), Git, Linux, Docker, Node.js

EDUCATION

- **Penn State University** University Park, PA
Coursework in Computational Data Science
